

# Linear Algebra

**Matrices**: Rectangular array of numbers in rows & columns

**vectors**: both size & direction

$$v = \begin{bmatrix} v_1 \\ v_2 \\ \vdots \\ v_n \end{bmatrix}$$

Uses: To solve linear equations  
Linear Transformations  
Eigen values & Eigen Vectors  
PCA  
Neural networks  
Linear Regression.

Linear Equations: Represents straight line when plotted  
1<sup>st</sup> power of variable is 1

$$Ax + By = C$$

$$\begin{aligned} 2x + 3y &= 8 \\ y &= 5x - 1 \\ x &= 4 \end{aligned}$$

Gaussian elimination: Used to solve system of linear Equations

Example:

$$\begin{aligned} x - 2y + z &= 0 \\ 2x + 2y - 3z &= 5 \\ 4x - 7y + z &= -1 \end{aligned}$$

$$Ax = b$$

STEP 1:

Augmented matrix  $\rightarrow \left[ \begin{array}{ccc|c} 1 & -2 & 1 & 0 \\ 2 & 2 & -3 & 5 \\ 4 & -7 & 1 & -1 \end{array} \right]$

STEP 2:

1<sup>st</sup> Goal  $\rightarrow$  0 below 1<sup>st</sup> entry in 1<sup>st</sup> column using Row operations

$$\left[ \begin{array}{ccc|c} -1 & -2 & 1 & 0 \\ 2 & 2 & -3 & 5 \\ 4 & -7 & 1 & -1 \end{array} \right] \xrightarrow{\substack{-2r_1 + r_2 \\ -4r_1 + r_3}} \left[ \begin{array}{ccc|c} 1 & -2 & 1 & 0 \\ 0 & 5 & -5 & 5 \\ 0 & 1 & -3 & 1 \end{array} \right]$$

STEP 3:

and so on: 0 below and above in second column

steps: 2<sup>nd</sup> goal: 0 below 2<sup>nd</sup> entry in second column using row operations.

$$\begin{bmatrix} 1 & -2 & 1 & 0 \\ 0 & 5 & -5 & 5 \\ 0 & 1 & -3 & -1 \end{bmatrix} \xrightarrow{r_2 \leftrightarrow r_3} \begin{bmatrix} 1 & -2 & 1 & 0 \\ 0 & 1 & -3 & -1 \\ 0 & 5 & -5 & 5 \end{bmatrix}$$

$$\begin{bmatrix} 1 & -2 & 1 & 0 \\ 0 & 1 & -3 & -1 \\ 0 & 5 & -5 & 5 \end{bmatrix} \xrightarrow[-r_2]{-5r_2 +} \begin{bmatrix} 1 & -2 & 1 & 0 \\ 0 & 1 & -3 & -1 \\ 0 & 0 & 10 & 10 \end{bmatrix}$$

echelon form

STEP 4: Use 2<sup>nd</sup> row to find the third unknown (z) & find 1<sup>st</sup> & 2<sup>nd</sup> similarly.

$$10z = 10$$

$$\boxed{z = 1}$$

solve for 2<sup>nd</sup> unknown (y)

$$y - 3z = -1$$

$$y = -1 + 3z$$

$$y = -1 + 3$$

$$\boxed{y = 2}$$

solve for 1<sup>st</sup> unknown (x)

$$x - 2y + 1 = 0$$

$$x = 2y - 1$$

$$x = 4 - 1$$

$$x = 3$$

$$\boxed{(x, y, z) \rightarrow (3, 2, 1)}$$

solution of system

Cases of Gaussian elimination method:

Case 1

$$\left[ \begin{array}{ccc|c} 1 & 2 & 3 & 10 \\ 0 & 2 & 4 & 5 \\ 0 & 0 & 3 & 3 \end{array} \right]$$

↑            ↑  
tunn    cunn

When  $t_{un} \neq 0$

Unique solution

Consistent system

Case 2

$$\left[ \begin{array}{ccc|c} 1 & 2 & 3 & 10 \\ 0 & 2 & 4 & 5 \\ 0 & 0 & 0 & 3 \end{array} \right]$$

↑            ↑  
tunn    cunn

When  $t_{un} = 0$   
 $c_{un} \neq 0$

No solution

Inconsistent contradiction

Case 3

$$\left[ \begin{array}{ccc|c} 1 & 2 & 3 & 10 \\ 0 & 2 & 4 & 5 \\ 0 & 0 & 0 & 0 \end{array} \right]$$

↑            ↑  
tunn    cunn

When  $t_{un} = 0$   
 $c_{un} = 0$

"Infinitely many solutions"

Consistent

## REF and RREF

### REF

$$\begin{bmatrix} a & b & c \\ 0 & d & e \\ 0 & 0 & f \end{bmatrix}$$

0's below pivots  
all non zero rows  
above all zero rows

example:  $\begin{bmatrix} 0 & 1 & 2 & 2 \\ 0 & 0 & 2 & 1 \\ 0 & 0 & 0 & 3 \end{bmatrix}$

after REF in linear equation

- Gaussian elimination substitution can be done to get values.
- REF not for inverse matrix since it is not fully reduced.

### RREF

$$\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

1s at leading places (pivots)  
and pivot column each has only 1 non zero value

example:  $\begin{bmatrix} 1 & 7 & 0 & 2 & 0 \\ 0 & 0 & 1 & 3 & 0 \\ 0 & 0 & 0 & 0 & 1 \end{bmatrix}$

"fully simplified"

- easier to interpret results.
- Used to find inverse of matrix

## Inverse of Matrices:

Use elementary operation to  
Transform matrix into Reduced REF

### Conditions for Inverse:

Square matrix  
 $n \times n$

Full rank  
(linearly independent)

$$\det(\text{Matrix}) \neq 0$$

If  $A^{\text{RREF}}$  = full rank  
Inverse exists

If last row of  $A^{\text{RREF}}$   
are all zero then  
It is not full rank  
as -1 doesn't occur.

If  $A$  is full rank then,

$$A^{-1} = E_r E_{r-1} \dots E_1$$

(all elementary ops)

Inverse of  $2 \times 2$

$$A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$$

$$A^{-1} = \frac{1}{ad-bc} \begin{bmatrix} d & -b \\ -c & a \end{bmatrix} \quad 2 \times 2$$

exists only if  $ad-bc \neq 0$

Inverse for  $3 \times 3$

$$A^{-1} = \frac{1}{|\det(A)|} \text{adj}(A) \quad 3 \times 3$$

exists if  $\det(A) \neq 0$

- Steps: 1. Find  $\det(A)$  if  $\neq 0$ , continue  
( $3 \times 3$ ) 2. Find cofactor of  $C_{ij}$  each and make Cofactor matrix  
3. Make adjugate matrix: Transpose of cofactor matrix  
4. Divide  $\text{adj}(A)$  with  $\det(A)$

## Rank Nullity Theorem

Rank: no. of linearly independent rows or cols vectors of matrix  
# (non zero eigen values of matrix)

Nullity: how many independent solutions exist to homo. eq.  $Ax=0$

Example:

$$A = \begin{bmatrix} 1 & 2 & 3 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix}$$

$$R(A) = 1, N(A) = 2, n = 3 \\ 1+2=3$$

$$A = \begin{bmatrix} 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 \end{bmatrix}$$

$$R(A) = 4 \\ N(A) = 2 \\ n = 6$$

For any matrix  $A$  of size  $m \times n$

$$[A]_{m \times n}$$

Rank Nullity Theorem states that:

$$\text{Rank}(A) + \text{Nullity}(A) = n \quad (\text{no. of columns})$$
